Fortune 500 Company Saves more than \$2.5M with BullsEye's Software Solutions

For ten years, a fortune 500 biotech company has been using BullsEye's software solutions to track inventory, streamline business processes, and stay compliant. Regulatory compliance dictates that batches created with inaccurately weighed or incorrect ingredients be scrapped. One scrapped batch can cost the client tens of thousands of dollars, and without the proper controls these events occur weekly (adding up to hundreds of thousands of dollars each year). BullsEye's applications interface with both Oracle E-

Business Suite and shopfloor scales to obtain instant and accurate data; they help control the client's liquid and powder media batch production, replacing outdated and inefficient paperbased systems in verification of all components and equipment used in production. The software also offers a compliance feature that tracks all ingredients and their usage. For example, the system keeps an audit log each time a component is verified and weighed.

BullsEye Saves Time and Money, While Helping to Meet Regulatory Compliance

- BullsEye has played an important role in helping many Oracle users achieve regulatory compliance. Providing an audit trail and electronic batch records has proven to be invaluable for production and QA/QC.
- Over the years, BullsEye's software has been used in the pharmaceutical, biotech and food processing verticals for tracking incoming and outgoing shipments, as well as inventory movement.
- BullsEye's solutions have helped companies streamline their business processes in setting up globalization strategies.

Additional features include production labor tracking and supervisor signoff upon exceptions. BullsEye's software has helped the client eliminate wasted batches and stay compliant.

In the pharmaceutical and biotech verticals, everything must be tracked and accounted for. BullsEye has developed barcode solutions for the client to help track material, from incoming shipments, to warehouse inventory movements and batch consumption. Barcode labels are applied and scanned at the appropriate stages in the workflow: this provides instant visibility and facilitates inventory accuracy, along with vast labor savings.

The client's shipping process has also been streamlined with BullsEye's interface between Oracle E-Business Suite and the company's freight carriers. The software keeps track of all shipments leaving each facility. When packages are picked up by the freight carriers, tracking numbers and shipping charges are recorded, and are then uploaded to Oracle for Invoicing and further processing.
